# Invention Discovery Report

Powered by **TURBOPATENT** The leader in Automated Invention Protection. Patent Pending.

The report is intended to help you evaluate product-level documentation for evidence of patentable inventions. Evaluating the patentability and originality of an idea is the first step toward securing the protection of a high-quality patent application.

TurboPatent is ready to assist you with any or all of three possible next steps:

- **A report on "prior art", known inventions most nearly relevant to your invention.**
- **A consultation with one of our team of patent engineers**
- **Preparing and filing a formal patent application with the US Patent and Trademark Office**

Traditional firms prepare and file applications at significant cost to the inventor, around \$15,000 apiece. At TurboPatent, we've developed machine learning and big data tools to perform many patenting tasks automatically, at higher quality and lower cost. We engineer our patent applications as a service, using our technology to prepare stronger, higher-quality applications in less time and at far lower cost than traditional law firms.

## Understanding your report

The TurboPatent Invention Discovery Report is a preliminary step to evaluate typical, product-level documentation (user guides, product specs, product requirements, architecture documents, etc.) for the evidence of potentially patentable inventions. By multiple levels of semantic analysis, it reduces documents to their core ideas and concepts, so those ideas and concepts can be vetted for inventiveness and patentability. It paves the way to move forward with securing the protection of intellectual property afforded by a high quality patent application

### Originality test

Patent law in the United States limits a patent to the first person to come up with an idea and to file it. We use a semantic search engine with access to 10's of millions of previously filed patents, both in the US and around the world, to score your information for originality.

### Patentability test

Some categories of ideas are "off limits" for the patent office, even if they are original and valuable. Our machine learning algorithms are trained to understand this, based on many 10's of thousands of recent decisions issued by patent examiners.

## Who else is active in this area of invention?

Based on the topic area of your submission, below are the top five companies patenting in conceptually nearby areas in the last 12 months.

- lincoln global
- gaumard scientific
- international business machines
- cae
- zonar systems

## How active are inventors in this area?

Based on the topic of your submission, this indicates the level of recent patent activity conceptually nearby.
